

ALL USER STORIES *(most recent modification: 15.08.2025)*

Priority	User story <user type, performed task, benefit>	Acceptance criteria + tests	Acceptance test status
1	As an owner or analyst , I want to log in with my credentials so that I can access features permitted by my role .	☐ System displays a login page with Username and Password fields and a Login button. ☐ User enters a valid username (case-insensitive match) and password. ☐ If username is not found, system shows “Please enter a valid username” and re-prompts. ☐ If password is incorrect, system shows “Wrong password, please try again” and re-prompts ☐ On success, system displays “You have successfully logged in as Owner/Analyst” and routes to the dashboard home. ☐ User can return to login by selecting Log out from any page.	Not started ▾
2	As a user , I want to filter data by year, animal class , and one additional attribute so that I can focus on relevant animals .	☐ Dashboard displays three search-enabled selectors: Year, Animal Class (ewe, lamb, sire), and Attribute (e.g., breed or treatment). ☐ Each selector supports type-to-search and returns results within 300 ms on a dataset with 5,000+ IDs. ☐ Changing any selector updates all charts and metrics within 2 seconds. ☐ Clearing a selector resets dependent visualizations to “no selection” state. ☐ Invalid or empty selections show a friendly “No data for current filters” message.	Not started ▾

3	As a user , I want to view time-series charts of weight and growth so that I can track trends over time .	☐ Page shows line charts for weight and growth rate over time for the current filter. ☐ Hovering a point shows date, mean, min, and max values for that period. ☐ Empty years/series are not rendered. ☐ Toggling “Show individuals” overlays up to 20 selected animals; otherwise group averages are shown. ☐ Charts render within 2 seconds for a 25k-row dataset.	Not started ▾
4	As a user , I want summary metric cards (last day, last 15 days, last month, overall) so that I can quickly understand current status .	☐ The top of the page displays cards for mean, min, max (last day, last 15 days, last month, overall). ☐ Cards update instantly when filters change. ☐ If a window has insufficient data, the card shows “ <i>Insufficient data.</i> ” ☐ Values match the underlying dataset within rounding rules (2 decimal places).	Not started ▾
5	As a user , I want histograms of weights so that I can see how many animals fall into sale-relevant bands .	☐ Page shows a histogram for the selected metric (default: weight). ☐ User can adjust bin size; chart updates within 1 second. ☐ A legend displays count and percentage per bin on hover. ☐ If <3 data points, system displays “Not enough data for histogram.”	Not started ▾
6	As an owner , I want to download filtered data as CSV so that I can analyze it offline .	☐ A Download Data button is visible to Owner role and hidden for Analyst. ☐ Clicking Download exports only the data matching current filters; a toggle allows “ <i>Full dataset.</i> ” ☐ File format is CSV with a header row and UTF-8 encoding. ☐ Download completes within 3 seconds for 25k rows ☐ Attempted access by Analyst returns “ <i>You do not have permission to download raw data.</i> ”	Not started ▾

7	As a user , I want to export charts as images so that I can share visual insights .	☐ Each chart has an Export button with PNG and SVG options. ☐ Exported images include chart title, axis labels, and legend. ☐ Export matches current filters and visible series. ☐ Export completes within 2 seconds.	Not started ▾
8	As an owner , I want automated daily or weekly email summaries so that I can stay informed without opening the app .	☐ Settings allow enabling email reports and choosing Daily or Weekly. ☐ Email includes key metrics (last day, 15 days, month, overall) and at least one chart snapshot. ☐ Emails send automatically at the configured time; manual “ <i>Send now</i> ” triggers an immediate send. ☐ If no new data since last send, email includes “ <i>No new data</i> ” note. ☐ Delivery failures are logged and shown in an Admin/System status panel.	Not started ▾
9	As a system owner , I want the dataset to refresh automatically so that the dashboard is up to date without manual uploads .	☐ System checks for new cleaned data daily at a configured time. ☐ On new data, system ingests and re-computes summaries. ☐ A Status panel shows last refresh time and result (Success/Failed with error). ☐ Manual “ <i>Refresh now</i> ” re-runs ingestion. ☐ Ingestion is idempotent (no duplicate rows).	Not started ▾
10	As a user , I want the dashboard to remain responsive on large datasets so that it’s usable with limited connectivity .	☐ With 25k+ rows and typical 20 columns, initial load < 4 seconds on a standard connection. ☐ Changing any filter re-renders within 2 seconds. ☐ Charts never freeze the UI ☐ a loading indicator shows during long operations. ☐ Pre-aggregations or server-side queries are used to meet performance targets.	Not started ▾

11	As a data owner , I want confidential details protected so that unauthorized users cannot see sensitive info.	☐ EIDs and any farmer/location identifiers are visible only to Owner role; ☐ Analysts see anonymized IDs (e.g., hashed or masked). ☐ Direct URL access to restricted endpoints returns 403 for non-authorized roles. ☐ All downloads are audited with username, timestamp, filter context, and row counts. ☐ Session timeout and secure password storage are enforced.	Not started ▾
12	As an owner , I want a daily summary report showing on the dashboard so that I can quickly review when I opened the app.	☐ System checks for new cleaned data daily at a configured time. ☐ On new data, system ingests and re-computes summaries. ☐ A Status panel shows last refresh time and result (Success/Failed with error).	Not started ▾

	As a product team , I want the app to support a database backend so that we can scale beyond CSVs.	☐ Configuration supports CSV/Excel or a relational DB (e.g., PostgreSQL/MySQL). ☐ When DB is enabled, filters execute as parameterized queries ☐ results match CSV mode. ☐ Switching data source does not change UI behavior. ☐ DB credentials are stored securely and not exposed to clients.	Not started ▾
